

FOBA is a leading supplier of complete photo studio equipment. Among other products FOBA also offers special products for optical measurement technology.

Unlike traditional photo studios where the stands are moved only a few meters and where floors are usually level, stands used in measurement technology carrying measuring equipment are moved much more often. Here the stands are rolled from one room to another, over doorsteps and other obstacles, often even transported by vehicle to another working place.

FOBA meets the needs of industrial measurement technology by providing stable, high precision stands which are easily movable.

The AROBI (DSS-GAMMA) stand is now also available with a movable caster base with following features:

- The casters have ball-bearings; a single pedal for each caster serves as a lock for rolling and rotating movement
- The construction of the base enables it to be tilted and roll on two casters, to get through a door, for example
- Only one person is needed to move the caster base, as it weighs only 25 kg
- To achieve better stability, an extra weight of ca. 7.5 kg can be screwed underneath each blade
- Two tappets situated where the stand is screwed onto the base attach the column into the right place at first try

Furthermore, the horizontal arm can be screwed off the central cross part and the counterweight inside the column can be detached with a snap hook.

This way the stand can be easily dismantled, transported and mounted again by a single person, as each component weighs less than 30 kg.

New caster base for the AROBI stand (ARBOF)

Detail of the center of the caster base ARBOF

AROBi Stand
Standard height ca. 2.0 m
Weight ca. 77 kg

Made in Switzerland, made by FOBA
